RECOVERY 07

IGF-1 LR3

Man-made analogue of insulin-like growth factor 1 with an added chain and one amino acid changed

CLASS	STUDIED FOR	HUMAN EVIDENCE	US STATUS
Peptide	Growth in animals	Lab or animal only	Not FDA approved

STUDIED FOR

- **Body growth** — ANIMAL
- **Fetal growth** — ANIMAL

Not the same as Increlex. Mecasermin (Increlex), the approved IGF-1 drug, has the body's natural sequence. IGF-1 LR3 has no published human study.

HOW IT WORKS IN THE BODY

IGF-1 LR3 ▶ Weak protein bind ▶ IGF-1 signaling ▶ Growth (animals)

- **Binds about 1,000 times less** to the IGF binding proteins in blood
- **In rats,** cleared faster than IGF-1 yet about six times more potent for growth
- Used mainly in **cell culture and animal research**
- **In people,** the mechanism is not established

EVIDENCE & WHAT'S KNOWN

EVIDENCE

LAB OR ANIMAL
LEVEL 1 OF 5

- No published human studies
- Rat, pig, sheep and cell studies
- No registered clinical trials

NOT YET ESTABLISHED

- Any human safety data
- Half-life in people
- Side-effect profile
- Dose in people

QUICK PRACTICAL INFO

HALF-LIFE	ROUTES STUDIED
Not established in people	Not established in people
PHARMACOKINETICS	**SOLD AS**
Not established in people	"Research use only" (not for human use)
MONITORED IN TRIALS	**SPORT (WADA)**
Not established in people	Prohibited, class S2

REGULATORY

FDA	Not approved; Increlex is a different drug
WADA	Prohibited (S2.3, IGF-1 analogues)
